

INFORMATION SHEET

Cicadas are insects known for their mating song sung by males. There are more than 3,000 species of cicada worldwide. Most cicadas live for 2 to 5 years and are active during the end of spring and early summer. One species of cicada however, the Magicada, found in Eastern North America is a periodical cicada and it has a 17 year life cycle. These cicadas spend almost all of their lives underground and only emerge for a few weeks after 17 years to mate, lay eggs and then die.

Each cicada has a distinct colour pattern and from this they get their names. See if you can match the cicadas to their names.
